IDEATION PHASE

Define the Problem Statements

Project: Heart Disease Analysis

Team Members: Mounika Sanapathi (Team Lead), Thakasi Balaji, Kale Sai Praneeth, Navyasri Gonnuri, Shanthi Kumari Challa

PS-1

I am: Healthcare Provider / Cardiologist

I'm trying to: Understand patient cardiovascular clinical metrics, identify critical risk factors, and monitor prevalence patterns across different age groups and genders.

But: The clinical data is scattered across thousands of complex medical records and is difficult to interpret manually.

Because: There is no centralized, interactive dashboard to summarize clinical metrics, risk densities, and diagnostic correlations.

Which makes me

feel: Frustrated because critical, life-saving diagnostic decisions and preventive healthcare interventions become slower and less data-driven.

PS-2

I am: Clinical Research Analyst

I'm trying to: Analyze correlations between various physiological metrics (like cholesterol, blood pressure, and maximum heart rate) and patient diagnoses using interactive visualizations.

But: Raw clinical datasets contain extensive patient parameters that are difficult to evaluate without advanced analytical tools.

Because: Manual medical data analysis is time-consuming, and meaningful underlying health trends are easily overlooked.

Which makes me

feel: Inefficient because valuable, predictive patient care insights may be missed.

Problem to Solution Flow

Raw Clinical Dataset → Data Cleaning → Tableau Dashboard & Story → Healthcare Insights → Better Diagnostic Decision Making
